

Building on our potential, experience and expertise in the field of ballistic protection and camouflage, we have created the world's first integrated vehicle protection system against damage. The system consists of two layers and combines the characteristics for ballistic protection (bottom layer of the composite) and masking (top layer). With this connection, the object is protected against projectiles and splinter generated during an explosion and the top vehicle masking layer, which may have come in any colour and design, masks an object in the optical and near-infrared range and protects against heat and radar detection.

Protection:

- VIS, special design of mobile camouflage perfectly blends with the natural surroundings and ensures effective protection against optical reconnaissance systems and armed and naked eye.
- NIR, re+emission properties effectively mimic the natural environment, offering protection against night vision devices.
- TIR, reduction of thermal radiation to 85%.
- RADAR, bidirectional radar attenuation to level of 20 dB.
