

PPWS Tajfun-37 Version 2.0 is a tactical backpack which, compared to its predecessor, has a new frame and carrying system. It is a major innovation on the Polish and global market. The frame effectively transfers the load from the shoulders to the hips, and therefore it allows the user to carry a greater load over a longer distance, without restricting their movements. The unique arrangement of the backpack harness allows for free movement of the upper limbs, because the shoulder space is not restricted by any elements of the backpack. This allows the user to assume shooting positions without any problems – both with short and long firearms. In addition, the ROC buckle applied in the harness allows the user to carry the backpack in a traditional way. The carrying system has a wide, two-stage adjustment range. Compared to its predecessor, Version 2.0 also differs in a specially designed compression system connected to the hip belt, which stabilizes the backpack much more efficiently. As a result, the user's comfort is improved dramatically.

The backpack features two independent compartments designed to allow the user to use all available space. The main compartment has two zipped pockets. The rear part of the main compartment features six rows of PALS / MOLLE tapes and a Velcro strap, which allows the user to configure the inside of the backpack according to individual needs. Moreover, inside the compartment there is a rubber band in the form of tunnels for securing small items. The open compartment is used for carrying clothes or larger items. The compartment is also equipped with a system for mounting items, such as a bottle or water flask, which otherwise might move inside while the backpack is used and so cause discomfort. The front compartment features three open pockets and one zipped mesh pocket. Both compartments have fasteners enabling the installation of a Camelback hydration system and openings sealed with rubberized material for running the hydration system tube or hoses. The front of the backpack features two flat pockets. The larger pocket has two vertical, side zippered entrances. The smaller pocket has a horizontal zipper located in the upper part of the pocket. PPWS Tajfun-37 has a double bottom used as a pocket for carrying a rain cover. Externally, the backpack has PALS / MOLLE system straps for attaching additional pouches and pockets.

Product Features:

- Dimensions: 53 x 33 x 21 [cm]
- Capacity: approx. 37 l
- Weight: approx. 2.5 kg
- Materials: CORDURA® 500 den
- Pockets:
 - Two independent compartments closed with a two-way zippers
 - Two front pockets
 - Bottom pocket with a rain cover
 - Two zipped pockets inside the main compartment
 - Three free pockets in the front compartment
 - Zipped mesh pocket inside the front compartment
- Innovative frame
- Innovative compression system
- Special profiled padding on the backside
- Three openings for wires or antennas
- ID label Velcro on the front
- Trekking poles / ice ax holder
- Hip belt with the PALS / MOLLE system and zipped pockets
- Reinforced backpack grip
- Emergency grip hidden in the bottom pocket
- Side grips for transporting wounded persons
- Integrated rain cover
